Project Report: Digital Ambassador Portfolio

Introduction

This project represents the final step in my journey as a Digital Ambassador at VIT Bhopal. The program was designed to help us move beyond being just passive users of technology and instead become active digital leaders. Throughout the modules, I worked on building a professional digital presence, learning how to use industry-standard collaboration tools, and creating resources to help my peers stay safe online. For someone like me, specializing in AI and Machine Learning, these skills are just as important as coding. This report breaks down my approach to all five tasks, what I learned along the way, and the main lessons I took home regarding professional responsibility and staying safe in our modern digital economy.

Task 1 Write-up: Digital Awareness

For the first module, I put together a presentation focused on digital trends and what it means to be a good digital citizen. I specifically looked at how technologies I'm interested in, like Artificial Intelligence, Machine Learning, and IoT, are changing the way we study and work. I used Canva to make the slides look clean and easy to follow because I wanted them to be useful for my classmates. One big takeaway for me was realizing that while almost everyone uses AI tools now, very few people actually think about the ethics or the bias behind the algorithms. Designing this presentation taught me how to take a complex technical topic and explain it in a way that anyone can understand, which is a huge part of being a successful technologist.

Task 2 Write-up: Digital Portfolio and Identity

In the second module, I focused on organizing my professional identity. I made sure my VTOP profile was properly linked with the platforms I use for work and code, like GitHub, LinkedIn, HackerRank, and Microsoft Teams. My goal was to make sure that anyone looking at my profiles could clearly see my focus on AI and ML, as well as my interest in hardware projects like my medical vending machine and the work we do in the NeuroXAI club. I plan to keep my LinkedIn updated with my latest projects as I move forward. The most important thing I learned is that we all have a digital footprint whether we like it or not, so it’s much better to take control of it early to make a great first impression on future employers.

Task 3 Write-up: Platforms and Collaboration

The third module was all about proving I can handle the tools used in the professional tech world. I shared proof of my activity on GitHub, where this project is hosted, as well as my work on Microsoft Teams and my problem-solving practice on HackerRank. I even practiced setting up a Google Form to see how data collection works on the fly. As a student working with IoT and AI, mastering these platforms isn’t just an extra skill; it’s a necessity. This task really helped me

get comfortable with version control using Git. Learning how to manage code properly is essential for the kind of complex machine learning models and hardware integrations I want to build in the future.

Task 4 Write-up: Professional Email and Etiquette

This task gave me a chance to practice writing clear and respectful emails, which is a skill I'll use every day. I drafted two specific messages: one asking a professor for an extension on an assignment and another inquiring about an AI and ML internship. I kept them as plain text to make sure they looked professional and were easy to read on any device. I learned that small details, like a clear subject line with my registration number, actually make a huge difference in how fast someone responds. I also created a social media checklist that served as a good reminder that my behavior on sites like LinkedIn is a professional asset I need to protect carefully.

Task 5 Write-up: Cybercrime Awareness and Prevention

For the final part of the program, I looked into the kinds of financial scams that target students, specifically UPI and QR code fraud. I wrote a case study to show how easily someone can be tricked through social engineering. I was honestly surprised to see how scammers don't even need high-tech hacking; they just use pressure and fake scholarship offers to make people act without thinking. Because of this research, I've completely changed my own habits. I will never scan a QR code just to receive money again, and I'll always double-check with the sender before clicking a financial link. As an ambassador, I want to make sure my friends at VIT remember the simple rule: a PIN is only for sending money.

Conclusion

Participating in the Digital Ambassador Program has given me a solid foundation for my professional life. Even though I started with a focus on AI and IoT hardware, I'm finishing the program with a much better understanding of the human side of technology. I've learned about reputation management, ethical communication, and the importance of being proactive about cybersecurity. These tasks weren't just about finishing an assignment; they provided a practical guide on how to be a responsible and aware digital citizen. I feel much more prepared to navigate the professional world and to help others do the same as technology continues to change our lives.
